

## How to configure Verizon Private Network (NEMO/DMNR)

### Summary

Verizon private network gives you a segregated private network to connect your mobile devices to and separates your data from public traffic and provides a direct connection back to your internal network. It enables integration between cellular wireless and wireline enterprise services by making use of the Mobile IPv4 network mobility (NEMO) protocol and without the need for end to end overlay tunneling.

This configuration guide shows an example setup of BEC 200A/Ae NEMO with Verizon Wireless Dynamic Mobile Network Routing (DMNR) service for the purposes of providing communications over Verizon 4G/LTE wireless access and mobile private network between branch and customer's H.Q. network.

### Network Topology

### NEMO Configuration

NEMO requires a service provider, e.g. Verizon Wireless Private Network with DMNR (Dynamic Mobile Network Routing). Your NEMO service provider will define many of the settings for your NEMO configuration.

Step 1: Log into router's Web GUI page.

Step 2: click on the **Configuration / Advanced Setup / NEMO**.

The screenshot displays the BEC 4G/LTE M2M Router web GUI. The left sidebar contains a navigation menu with the following items: Status, Quick Start, Configuration (expanded), Interface Setup, Dual WAN, Advanced Setup (expanded), Firewall, Routing, Dynamic Routing, NAT, VRRP, Static DNS, QoS, Time Schedule, Mail Alert, Serial Port, NEMO, VPN, Access Management, and Maintenance. The main configuration area is titled '4G/LTE M2M Router' and 'Configuration'. Under the 'NEMO' section, the following settings are visible: Network Mobility (radio buttons for Activated and Deactivated, with a red arrow pointing to Activated), Home IP Address (text input field containing 1.2.3.4, with a red arrow pointing to the field), Home Agent IP Address (text input field containing 66.174.248.193, with a red arrow pointing to the field), Home Agent Password (password input field containing \*\*\*\*\* with a red arrow pointing to the field), Home Agent SPI (text input field containing 256, with a red arrow pointing to the field), and Renew Registration (text input field containing 300, with a red arrow pointing to the field). A Save button is located at the bottom of the configuration area.

Step 3: Select “Activated” to enable the Network Mobility.

Step 4: Home IP address – It provided by Verizon. The address is a placeholder, any IP address can be used (1.2.3.4 is common).

Step 5: Home agent IP address, Password, and SPI will be defined by service provider (Verizon).

Step 6: Renew Registration – The NEMO network regularly re-registers with the home agent.

Step 7: Click “Save” to save the setting.

## Status

The router should create tunnel automatically as soon as the NEMO configuration settings are saved. You can see status at **Status / NEMO Status** on the Web GUI page.

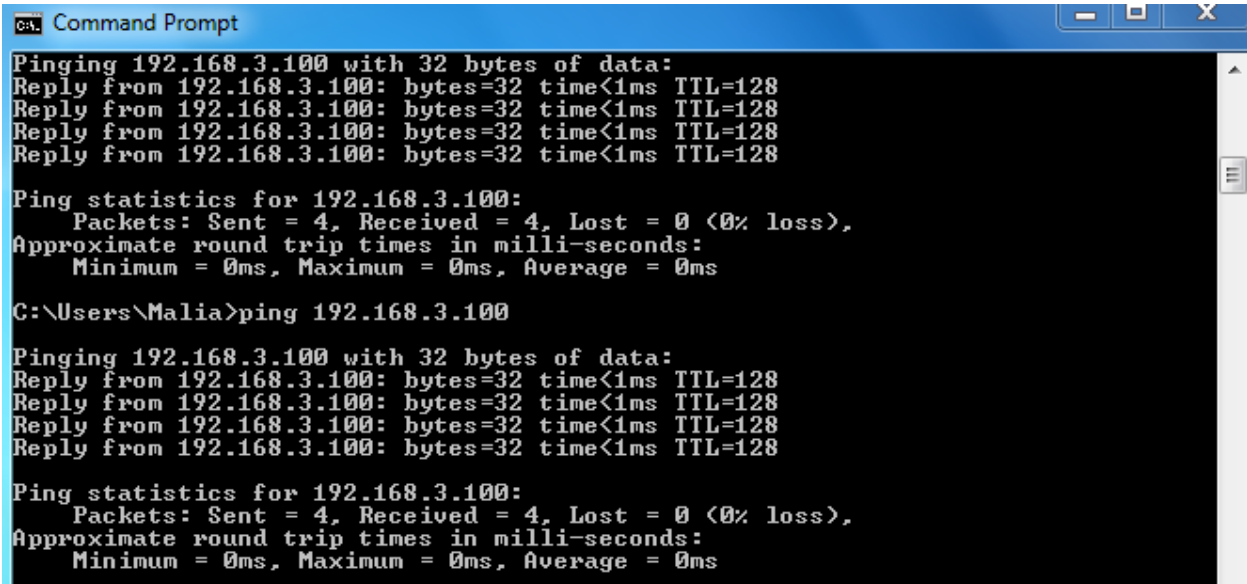

The screenshot shows the BEC 4G/LTE M2M Router Web GUI. The left sidebar contains a menu with 'Status' selected and 'NEMO Status' highlighted with a red arrow. The main content area shows the 'Status' page with 'NEMO Status' expanded. The 'State' is 'Connected' (highlighted with a red arrow) and the 'HA-addr' is '66.174.248.193'. A 'Refresh' button is visible below the status information.

## Ping Test

Ping from BEC MX-200A to show the LAN interface has traversed the NEMO tunnel.

```
[iMac ██████████] ping 192.168.0.1
